Bugs:

Method: When i run the app it through me "Method Not Allowed" error.

Solution : here the method defined is "POST", here the requirement is to create a route which listen to both "GET" as well as "POST" method.

Note: If you use only GET method, the application work fine, but the Note which we input will appear in the url query parameters. Hence it is better to choose POST method while returning something.

Adding empty note: When I try Click on button "Add Note" without adding any text in input box, It will add empty Note.

Solution: here i have used if condition {% if note!="" %} means add note if it is not empty and display in the form of unorded list.
